Continuum of Care HIV/AIDS
Nevada, 2020

Of persons who had been diagnosed with HIV through year-end 2018, 11,161 were alive at year-end 2019. Of the 11,161 PLWH, 28.8% were retained in care (percentage of persons who had ≥ 2 CD4 or viral load tests at least three months apart during 2019 among those diagnosed with HIV through year-end 2018 and alive at year-end 2019). Among those retained in care at the end of 2019, 84.2% had suppressed viral load (≤ 200 copies/mL) at the most recent test during 2019. Among PLWH year-end 2018 and alive at year-end 2019, 25.9% had suppressed viral load (≤ 200 copies/mL) at most recent test during 2019.

Of the 506 newly diagnosed cases of HIV in 2019, 81.8% were linked to care within three months after diagnosis during 2019.

Source: Division of Public and Behavioral Health, HIV/AIDS Reporting System (eHARS), data as of March 2020.

#Persons Living with HIV indicate any person regardless of HIV staging, including HIV stage 3 (AIDS).

^aDefined as persons diagnosed with HIV infection (regardless of stage of disease) through year-end 2018, who were alive at year-end 2019.

^bCalculated as the number of persons linked to care within 3 months after HIV diagnosis during 2019, divided by the total number of persons diagnosed with HIV infection in 2019. Linkage to care is based on the number of persons diagnosed during 2019, and is therefore shown in a different color than the other bars with a different denominator.

^cCalculated as the percentage of persons who had ≥ 2 CD4 or viral load test results at least 3 months apart during 2019 among those diagnosed with HIV through year-end 2018 and alive at year-end 2019.

^dCalculated as the percentage of persons who had suppressed VL (≤ 200 copies/mL) at most recent test during 2019, among those diagnosed with HIV through year-end 2018 and alive at year-end 2019.

[†]Calculated as number of persons who had suppressed VL (≤ 200 copies/mL) at most recent test during 2019, among those who were retained in care during 2019.
