Continuum of Care HIV/AIDS
Nevada, 2020

Of persons who had been diagnosed with HIV through year-end 2019, 11,192 were alive at year-end 2020. Of the 11,192 PLWH, 47.3% were retained in care (percentage of persons who had ≥ 2 CD4 or viral load tests at least one month apart during 2020 among those diagnosed with HIV through year-end 2019 and alive at year-end 2020). Among those retained in care at the end of 2020, 91.9% had suppressed viral load (≤ 200 copies/mL) at the most recent test during 2020. Among PLWH year-end 2019 and alive at year-end 2020, 43.4% had suppressed viral load (≤ 200 copies/mL) at most recent test during 2020.

Of the 373 newly diagnosed cases of HIV in 2020, 69.5% were linked to care within one month after diagnosis during 2020.

Source: Division of Public and Behavioral Health, HIV/AIDS Reporting System (eHARS), data as of April 2021.

#Persons Living with HIV indicate any person regardless of HIV staging, including HIV stage 3 (AIDS).

^aDefined as persons diagnosed with HIV infection (regardless of stage of disease) through year-end 2019, who were alive at year-end 2020.

^bCalculated as the number of persons linked to care within one month after HIV diagnosis during 2020, divided by the total number of persons diagnosed with HIV infection in 2020. Linkage to care is based on the number of persons diagnosed during 2020, and is therefore shown in a different color than the other bars with a different denominator.

^cCalculated as the percentage of persons who had ≥ 2 CD4 or viral load test results at least one month apart during 2020 among those diagnosed with HIV through year-end 2019 and alive at year-end 2020.

^dCalculated as the percentage of persons who had suppressed VL (≤ 200 copies/mL) at most recent test during 2020, among those diagnosed with HIV through year-end 2019 and alive at year-end 2020.

[†]Calculated as number of persons who had suppressed VL (≤ 200 copies/mL) at most recent test during 2020, among those who were retained in care during 2020.
